# Eigenvalue problems for anisotropic discrete boundary value problems 

Mihai Mihăilescu $^{\text {ab1 }}$, Vicenţiu Rădulescu ${ }^{\text {ac* }}$ and Stepan Tersian ${ }^{\text {d2 }}$<br>${ }^{a}$ Department of Mathematics, University of Craiova, Craiova, Romania; ${ }^{b}$ Department of Mathematics, Central European University, Budapest, Hungary; ${ }^{\text {c }}$ Institute of Mathematics 'Simion Stoilow' of the Romanian Academy, Bucharest, Romania; ${ }^{d}$ Department of Mathematical Analysis, University of Rousse, Rousse, Bulgaria<br>(Received 6 November 2007; final version received 16 May 2008)

In this paper, we prove the existence of a continuous spectrum for a family of discrete boundary value problems. The main existence results are obtained by using critical point theory. The equations studied in the paper represent a discrete variant of some recent anisotropic variable exponent problems, which deserve as models in different fields of mathematical physics.

Keywords: eigenvalue problem; discrete boundary value problem; critical point; weak solution; continuous spectrum

## 1. Introduction and main results

This paper is concerned with the study of the existence of solutions for the discrete boundary value problem

$$
\left\{\begin{array}{l}
-\Delta\left(|\Delta u(k-1)|^{p(k-1)-2} \Delta u(k-1)\right)=\lambda|u(k)|^{q(k)-2} u(k), \quad k \in \mathbb{Z}[1, T]  \tag{1}\\
u(0)=u(T+1)=0
\end{array}\right.
$$

where $T \geq 2$ is a positive integer and $\Delta u(k)=u(k+1)-u(k)$ is the forward difference operator. Here and hereafter, we denote by $\mathbb{Z}[a, b]$ the discrete interval $\{a, a+1, \ldots, b\}$ where $a$ and $b$ are integers and $a<b$. Moreover, in this paper, we assume that functions $p: \mathbb{Z}[0, T] \rightarrow[2, \infty)$ and $q: \mathbb{Z}[1, T] \rightarrow[2, \infty)$ are bounded while $\lambda$ is a positive constant.

The study of discrete boundary value problems has captured special attention in the last years. We just refer to the recent results of Agarwal et al. [2], Cai and Yu [4], Yu and Guo [22], Zhang and Liu [23] and the references therein. The studies regarding such type of problems can be placed at the interface of certain mathematical fields such as nonlinear partial differential equations and numerical analysis. On the other hand, they are strongly motivated by their applicability in mathematical physics. We note that problem (1) is the discrete variant of the variable exponent anisotropic problem

$$
\begin{cases}-\sum_{i=1}^{N} \frac{\partial}{\partial x_{i}}\left(\left|\frac{\partial u}{\partial x_{i}}\right|^{p_{i}(x)-2} \frac{\partial u}{\partial x_{i}}\right)=\lambda|u|^{q(x)-2} u, & \text { for } x \in \Omega  \tag{2}\\ u=0, & \text { for } x \in \partial \Omega\end{cases}
$$

[^0]where $\Omega \subset \mathbb{R}^{N}(N \geq 3)$ is a bounded domain with smooth boundary, $\lambda>0$ is a real number, and $p_{i}(x), q(x)$ are continuous on $\bar{\Omega}$ such that $N>p_{i}(x) \geq 2$ and $q(x)>1$ for any $x \in \bar{\Omega}$ and all $i \in \mathbb{Z}[1, N]$. Problem (2) was recently analyzed by Mihăilescu-PucciRădulescu in Refs. [10,11] (see also the studies in Refs. [8,16,17,20,21] for the case, when $p_{i}(x)$ are constant functions). Problems like (2) have been intensively studied in the last decades, since they can model various phenomena arising from the study of elastic mechanics (see, Zhikov [24]), electrorheological fluids (see, Acerbi and Mingione [1], Diening [6], Halsey [9], Ruzicka [18], Mihăilescu and Rădulescu [12-15]) or image restoration (see, Chen, Levine and Rao [5]).

In this paper, our goal is to use the critical point theory in order to establish the existence of a continuous spectrum of eigenvalues for problems of type (1). Our idea is to transfer the problem of the existence of solutions for problem (1) into the problem of existence of critical points for some associated energy functional. On the other hand, we point out that, to our best knowledge, discrete problems like (1), involving anisotropic exponents, have not yet been discussed. Thus, the present paper can be regarded as a contribution in this direction.

We are interested in finding week solutions for problems of type (1). For this purpose, we define the function space

$$
H=\{u: \mathbb{Z}[0, T+1] \rightarrow \mathbb{R} ; \text { such that } u(0)=u(T+1)=0\} .
$$

Clearly, $H$ is a $T$-dimensional Hilbert space (see [2]) with the inner product

$$
(u, v)=\sum_{k=1}^{T+1} \Delta u(k-1) \Delta v(k-1), \quad \forall u, v \in H
$$

This associated norm is defined by

$$
\|u\|=\left(\sum_{k=1}^{T+1}|\Delta u(k-1)|^{2}\right)^{1 / 2}
$$

By a weak solution for problem (1) we understand a function $u \in H$ such that

$$
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)-2} \Delta u(k-1) \Delta v(k-1)-\lambda \sum_{k=1}^{T}|u(k)|^{q(k)-2} u(k) v(k)=0,
$$

for any $v \in H$.
Denote for short $\max _{k \in \mathbb{Z}[a, b]} p(k)$ by $\max _{\mathbb{Z}[a, b]} p$ and $\min _{k \in \mathbb{Z}[a, b]} p(k)$ by $\min _{\mathbb{Z}[a, b]} p$. The main results of this paper are the following.

Theorem 1. Assume that functions $p$ and $q$ verify the hypothesis

$$
\begin{equation*}
\max _{\mathbb{Z}[0, T]} p<\min _{\mathbb{Z}[1, T]} q . \tag{3}
\end{equation*}
$$

Then for any $\lambda>0$ problem (1) has a nontrivial weak solution.

Theorem 2. Assume that functions $p$ and $q$ verify the hypothesis

$$
\begin{equation*}
\max _{\mathbb{Z}[1, T]} q<\min _{\mathbb{Z}[0, T]} p . \tag{4}
\end{equation*}
$$

Then, there exists $\lambda^{* *}>0$ such that for any $\lambda>\lambda^{* *}$ problem (1) has a nontrivial weak solution.

Theorem 3. Assume that functions $p$ and $q$ verify the hypothesis

$$
\begin{equation*}
\min _{\mathbb{Z}[1, T]} q<\min _{\mathbb{Z}[0, T]} p . \tag{5}
\end{equation*}
$$

Then, there exists $\lambda^{*}>0$ such that for any $\lambda \in\left(0, \lambda^{*}\right)$ problem (1) has a nontrivial weak solution.

Remark 1. We point out that if relation (5) is verified then relation (4) is fulfilled, too. Consequently, the result of Theorem 2 can be completed with the conclusion of Theorem 3. More exactly, we deduce the following corollary.

Corollary 1. Assume that functions $p$ and $q$ verify the hypothesis

$$
\min _{\mathbb{Z}[1, T]} q<\min _{\mathbb{Z}[0, T]} p .
$$

Then there exist $\lambda^{*}>0$ and $\lambda^{* *}>0$ such that for any $\lambda \in\left(0, \lambda^{*}\right) \cup\left(\lambda^{* *}, \infty\right)$ problem (1) possesses a nontrivial weak solution.

Remark 2. On the other hand, we point out that the result of Theorem 3 holds true in situations that extend relation (4) since in relation (5) we could have

$$
\min _{\mathbb{Z}[1, T]} q<\min _{\mathbb{Z}[0, T]} p<\max _{\mathbb{Z}[1, T]} q .
$$

## 2. Auxiliary results

From now on we will use the following notations:

$$
p^{-}=\min _{\mathbb{Z}[0, T]} p, \quad p^{+}=\max _{\mathbb{Z}[0, T]} p, \quad q^{-}=\min _{\mathbb{Z}[1, T]} q, \quad q^{+}=\max _{\mathbb{Z}[1, T]} q .
$$

On the other hand, it is useful to introduce other norms on $H$, namely

$$
|u|_{m}=\left(\sum_{k=1}^{T}|u(k)|^{m}\right)^{1 / m}, \quad \forall u \in H \text { and } m \geq 2
$$

It can be verified (see Ref. [4]) that

$$
\begin{equation*}
T^{(2-m) /(2 m)} \cdot|u|_{2} \leq|u|_{m} \leq T^{1 / m} \cdot|u|_{2}, \quad \forall u \in H \text { and } m \geq 2 \tag{6}
\end{equation*}
$$

We start with the following auxiliary result.

## Lemma 1.

(a) There exist two positive constants $C_{1}$ and $C_{2}$ such that

$$
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)} \geq C_{1} \cdot\|u\|^{p^{-}}-C_{2}, \quad \forall u \in H \text { with }\|u\|>1
$$

(b) There exists a positive constant $C_{3}$ such that

$$
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)} \geq C_{3} \cdot\|u\|^{p^{+}}, \quad \forall u \in H \text { with }\|u\|<1
$$

(c) For any $m \geq 2$ there exists a positive constant $c_{m}$ such that

$$
\sum_{k=1}^{T}|u(k)|^{m} \leq c_{m} \cdot \sum_{k=1}^{T+1}|\Delta u(k-1)|^{m}, \quad \forall u \in H
$$

Proof.
(a) Fix $u \in H$ with $\|u\|>1$. We define

$$
\alpha_{k}= \begin{cases}p^{+}, & \text {if }|\Delta u(k)|<1 \\ p^{-}, & \text {if }|\Delta u(k)|>1\end{cases}
$$

for each $k \in \mathbb{Z}[0, T]$.
We deduce that

$$
\begin{aligned}
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)} & \geq \sum_{k=1}^{T+1}|\Delta u(k-1)|^{\alpha_{k-1}} \\
& \geq \sum_{k=1}^{T+1}|\Delta u(k-1)|^{p^{-}}-\sum_{\left\{k \in \mathbb{Z}[0, T] ; \alpha_{k-1}=p^{+}\right\}}\left(|\Delta u(k-1)|^{p^{-}}-|\Delta u(k-1)|^{p^{+}}\right) \\
& \geq \sum_{k=1}^{T+1}|\Delta u(k-1)|^{p^{-}}-T
\end{aligned}
$$

The above inequality and relation (6) imply

$$
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)} \geq T^{\left(2-p^{-}\right) / 2} \cdot\|u\|^{p^{-}}-T, \quad \forall u \in H \text { with }\|u\|>1
$$

Thus, we proved that (a) holds true.
(b) Assume $u \in H$ with $\|u\|<1$. It follows that $|\Delta u(k)|<1$ for each $k \in \mathbb{Z}[0, T]$. So, by (6) we deduce that

$$
\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)} \geq \sum_{k=1}^{T+1}|\Delta u(k-1)|^{p^{+}} \geq 1 / T^{\left(2-p^{+}\right) / 2} \cdot \|\left. u\right|^{p^{+}}
$$

Thus, we proved that (b) holds true.
(c) Since

$$
|u(k)| \leq \sum_{i=0}^{k-1}|\Delta u(i)|, \quad \forall u \in H \text { and } k \in \mathbb{Z}[0, T]
$$

we deduce that for any positive real number $m \geq 2$, there exists a positive constant $c_{m, k}$ such that

$$
|u(k)|^{m} \leq c_{m, k} \cdot \sum_{i=0}^{k-1}|\Delta u(i)|^{m}, \quad \forall u \in H \text { and } k \in \mathbb{Z}[0, T] .
$$

The above information implies that there exists a positive constant $c_{m}$ such that

$$
\begin{equation*}
\sum_{k=1}^{T}|u(k)|^{m} \leq c_{m} \cdot \sum_{k=1}^{T+1}|\Delta u(k-1)|^{m}, \quad \forall u \in H \tag{7}
\end{equation*}
$$

The proof of Lemma 1 is complete.

## 3. Proof of the main results

For any $\lambda>0$ the energy functional corresponding to problem (1) is defined as $J_{\lambda}: H \rightarrow \mathbb{R}$,

$$
J_{\lambda}(u)=\sum_{k=1}^{T+1} \frac{1}{p(k-1)}|\Delta u(k-1)|^{p(k-1)}-\lambda \cdot \sum_{k=1}^{T} \frac{1}{q(k)}|u(k)|^{q(k)} .
$$

Standard arguments assure that $J_{\lambda} \in C^{1}(H, \mathbb{R})$ and

$$
\left\langle J_{\lambda}^{\prime}(u), v\right\rangle=\sum_{k=1}^{T+1}|\Delta u(k-1)|^{p(k-1)-2} \Delta u(k-1) \Delta v(k-1)-\lambda \sum_{k=1}^{T}|u(k)|^{q(k)-2} u(k) v(k),
$$

for all $u, v \in H$. Thus, the weak solutions of (1) coincide with the critical points of $J_{\lambda}$.

### 3.1 Proof of Theorem 1

In order to prove that $J_{\lambda}$ has a nontrivial critical point our idea is to show that actually $J_{\lambda}$ possesses a mountain-pass geometry. With that end in view, we start by proving two auxiliary results.

Lemma 2. There exist $\eta>0$ and $\alpha>0$, such that $J_{\lambda}(u) \geq \alpha>0$, for any $u \in H$ with $\|u\|=\eta$.

Proof. First, we point out that

$$
\begin{equation*}
|u(k)|^{q^{-}}+|u(k)|^{q^{+}} \geq|u(k)|^{q(k)}, \quad \forall k \in \mathbb{Z}[1, T] \text { and } u \in H \tag{8}
\end{equation*}
$$

Using the above inequality, we find

$$
\begin{equation*}
J_{\lambda}(u) \geq \frac{1}{p^{+}} \sum_{k=1}^{T+1} \frac{1}{p(k-1)}|\Delta u(k-1)|^{p(k-1)}-\frac{\lambda}{q^{-}}\left(|u|_{q^{-}}^{q^{-}}+|u|_{q^{+}}^{q^{+}}\right), \quad \forall u \in H \tag{9}
\end{equation*}
$$

Next, we focus on the case, when $u \in H$ with $\|u\|<1$. Thus, $|\Delta u(k)|<1$ for any $k \in \mathbb{Z}[0$, $T+1]$. Then, using Lemma 1(c) and relation (6), we infer

$$
\begin{align*}
|u|_{q^{-}}^{q^{-}}+|u|_{q^{+}}^{q^{+}} & \leq c_{q^{-}} \sum_{k=1}^{T+1}|\Delta u(k-1)|^{q^{-}}+c_{q^{+}} \sum_{k=1}^{T+1}|\Delta u(k-1)|^{q^{+}} \\
& \leq c_{q^{-}} T\|u\|^{q^{-}}+c_{q^{+}} T\|u\|^{q^{+}} . \tag{10}
\end{align*}
$$

For $u \in H$ with $\|u\|<1$ the above inequalities combined with relation (9), Lemma 1(b) and relation (6) imply

$$
\begin{aligned}
J_{\lambda}(u) & \geq \frac{C_{3}}{p^{+}}\|u\|^{p^{+}}-\frac{\lambda}{q^{-}}\left(c_{q^{-}} T \cdot\|u\|^{q^{-}}+c_{q^{+}} T \cdot\|u\|^{q^{+}}\right) \\
& =\left(d_{1}-d_{2} \cdot\|u\|^{q^{-}-p^{+}}-d_{3} \cdot\|u\|^{q^{+}-p^{+}}\right) \cdot\|u\|^{p^{+}}
\end{aligned}
$$

where $d_{1}, d_{2}$ and $d_{3}$ are positive constants.
We remark that the function $g:[0,1] \rightarrow \mathbb{R}$ defined by

$$
g(t)=d_{1}-d_{2} \cdot t^{q^{+}-p^{+}}-d_{3} \cdot t^{q^{-}-p^{+}}
$$

is positive in a neighborhood of the origin by continuity argument. We conclude that Lemma 2 holds true.

Lemma 3. There exists $e \in H$ with $\|e\|>\eta$ (where $\eta$ is given in Lemma 2) such that $J_{\lambda}(e)<0$.

Proof. Consider the function $\psi: \mathbb{Z}[0, T+1] \rightarrow \mathbb{R}$ such that there exists $k_{0}$ an integer satisfying $0<k_{0}<T+1$, for which $\psi\left(k_{0}\right)=1$ and $\psi(k)=0$ for any $k \in \mathbb{Z}[0, T+1] \backslash\left\{k_{0}\right\}$. Thus, we deduce that $\psi \in H$. For each $t>1$ we have

$$
J_{\lambda}(t \psi)=\frac{t^{p\left(k_{0}\right)}}{p\left(k_{0}\right)}+\frac{t^{p\left(k_{0}-1\right)}}{p\left(k_{0}-1\right)}-\lambda \cdot \frac{t^{q\left(k_{0}\right)}}{q\left(k_{0}\right)} \leq \frac{2 \cdot t^{p^{+}}}{p^{-}}-\lambda \cdot \frac{t^{q^{-}}}{q^{+}}
$$

Since $q^{-}>p^{+}$, it is clear that $\lim _{t \rightarrow \infty} J_{\lambda}(t \psi)=-\infty$. Then, for $t>1$ large enough, we can take $e=t \psi$ such that $\|e\|>\eta$ and $J_{\lambda}(e)<0$.

The proof of Lemma 3 is complete.

Proof of Theorem 1. By Lemma 2 and 3 and the mountain-pass theorem of Ambrosetti and Rabinowitz [3], we deduce the existence of a sequence $\left\{u_{n}\right\} \subset H$ such that

$$
\begin{equation*}
J_{\lambda}\left(u_{n}\right) \rightarrow \bar{c}>0 \quad \text { and } J_{\lambda}^{\prime}\left(u_{n}\right) \rightarrow 0 \text { as } n \rightarrow \infty \tag{11}
\end{equation*}
$$

We prove that $\left\{u_{n}\right\}$ is bounded in $H$. Arguing by contradiction, we assume that passing eventually to a subsequence, still denoted by $\left\{u_{n}\right\}$, we have $\left\|u_{n}\right\| \rightarrow \infty$. Thus, we may assume that for $n$ large enough, we have $\left\|u_{n}\right\|>1$.

Relation (11) and the above considerations imply that for $n$ large enough, we have

$$
1+\bar{c}+\left\|u_{n}\right\| \geq J_{\lambda}\left(u_{n}\right)-\frac{1}{q^{-}}\left\langle J_{\lambda}^{\prime}\left(u_{n}\right), u_{n}\right\rangle \geq\left(\frac{1}{p^{+}}-\frac{1}{q^{-}}\right) \sum_{k=1}^{T+1}\left|\Delta u_{n}(k-1)\right|^{p(k-1)}
$$

By Lemma 1(a) and the above inequality, we deduce that there exist two positive constants $D_{1}$ and $D_{2}$ such that

$$
1+\bar{c}+\left\|u_{n}\right\| \geq D_{1} \cdot\left\|u_{n}\right\|^{p^{-}}-D_{2}
$$

for $n$ large enough. Dividing by $\left\|u_{n}\right\|^{p^{-}}$in the above inequality and passing to the limit as $n \rightarrow \infty$, we obtain a contradiction. It follows that $\left\{u_{n}\right\}$ is bounded in $H$. That information combined with the fact that $H$ is a finite dimensional Hilbert space implies that there exists a subsequence, still denoted by $\left\{u_{n}\right\}$, and $u_{0} \in H$ such that $\left\{u_{n}\right\}$ converges to $u_{0}$ in $H$.

Then, by relation (11) we have

$$
J_{\lambda}\left(u_{0}\right)=\bar{c}>0 \quad \text { and } J_{\lambda}^{\prime}\left(u_{0}\right)=0
$$

We conclude that $u_{0}$ is a nontrivial weak solution of problem (1).

### 3.2 Proof of Theorem 2

For any $\lambda>0$, let $J_{\lambda}$ be defined as above.
Now, we show that $J_{\lambda}$ possesses a nontrivial global minimum point in $H$. With that end in view, we remark that Lemma 1(a) implies that $J_{\lambda}$ is coercive on $H$. On the other hand, it is obvious that it is also weakly lower semicontinuous on the finite dimensional Hilbert space $H$. These two facts enable us to apply Theorem 1.2 in [19] in order to find that there exists $u_{\lambda} \in H$ a global minimizer of $J_{\lambda}$ and thus, a weak solution of problem (1).

We show that $u_{\lambda}$ is not trivial for $\lambda$ large enough. Indeed, letting $t_{0}>1$ be a fixed real and defining the function $v_{0}: \mathbb{Z}[0, T+1] \rightarrow \mathbb{R}$ such that there exists an integer $k_{0}$ with $0<k_{0}<T+1$, for which $v_{0}\left(k_{0}\right)=t_{0}$ and $v_{0}(k)=0$ for any $k \in \mathbb{Z}[0, T+1] \backslash\left\{k_{0}\right\}$, we deduce that $v_{0} \in H$ and

$$
J_{\lambda}\left(v_{0}\right)=\frac{t_{0}^{p\left(k_{0}-1\right)}}{p\left(k_{0}-1\right)}+\frac{t_{0}^{p\left(k_{0}\right)}}{p\left(k_{0}\right)}-\frac{\lambda \cdot t_{0}^{q\left(k_{0}\right)}}{q\left(k_{0}\right)} \leq L_{1}-L_{2} \cdot \lambda,
$$

where $L_{1}$ and $L_{2}$ are two positive constants. Thus, there exists $\lambda^{* *}>0$, such that $J_{\lambda}\left(v_{0}\right)<0$ for any $\lambda \in\left[\lambda^{* *}, \infty\right)$. It follows that $J_{\lambda}\left(u_{\lambda}\right)<0$ for any $\lambda \geq \lambda^{* *}$ and thus, $u_{\lambda}$ is a nontrivial weak solution of problem (1) for $\lambda$ large enough. The proof of Theorem 2 is complete.

### 3.3 Proof of Theorem 3

For any $\lambda>0$ let $J_{\lambda}$ be defined as above.
We show that, by using the hypothesis of Theorem 3, the functional $J_{\lambda}$ has a nontrivial critical point by applying Ekeland's variational principle [7]. In order to do that we first prove two auxiliary results.

Lemma 4. There exists $\lambda^{*}>0$, such that for any $\lambda \in\left(0, \lambda^{*}\right)$ there exist $\rho, a>0$, such that $J_{\lambda}(u) \geq a>0$ for any $u \in H$ with $\|u\|=\rho$.

Proof. First, let us remark that for any $u \in H$, Lemma 1(c) implies

$$
c_{2} \cdot\|u\| \geq|u|_{2} .
$$

Combining that fact and inequality (6), we deduce that

$$
\begin{equation*}
c_{2} \cdot T^{1 / q^{-}} \cdot\|u\| \geq|u|_{q^{-}}, \quad \forall u \in H . \tag{12}
\end{equation*}
$$

We fix $\rho \in(0,1)$ such that $\rho<\min \left\{1,1 /\left(c_{2} \cdot T^{1 / q^{-}}\right)\right\}$. Thus, for any $u \in H$ with $\|u\|=\rho$, we have $|u|_{q-}<1$. It follows that, in this case, $|u(k)|<1$ holds for any $k \in \mathbb{Z}[0, T+1]$. Therefore,

$$
\begin{equation*}
\sum_{k=1}^{T}|u(k)|^{q(k)} \leq|u|_{q^{-}}^{q^{-}}, \quad \forall u \in H \text { with }\|u\|=\rho \tag{13}
\end{equation*}
$$

By relations (12) and (13), we obtain

$$
\sum_{k=1}^{T}|u(k)|^{q(k)} \leq c_{2}^{q^{-}} \cdot T \cdot\|u\|^{q^{-}}, \quad \forall u \in H \text { with }\|u\|=\rho .
$$

By Lemma 1(b) and the above relation we deduce that for any $u \in H$ with $\|u\|=\rho$, the following inequalities hold true

$$
J_{\lambda}(u) \geq \frac{C_{3}}{p^{+}} \cdot\|u\|^{p^{+}}-\frac{\lambda \cdot c_{2}^{q^{-}} \cdot T}{q^{-}} \cdot\|u\|^{q^{-}}=\left(C_{4} \cdot \rho^{p^{+}-q^{-}}-\lambda \cdot C_{5}\right) \cdot \rho^{q^{-}}
$$

where $C_{4}$ and $C_{5}$ are positive constants. By the above inequality and the fact that $q^{-}<p^{-} \leq p^{+}$, we remark that if we define

$$
\begin{equation*}
\lambda^{*}=\frac{C_{4} \cdot \rho^{p^{+}-q^{-}}}{2 \cdot C_{5}} \tag{14}
\end{equation*}
$$

then for any $\lambda \in\left(0, \lambda^{*}\right)$ and any $u \in H$ with $\|u\|=\rho$ there exists $a=C_{4} \cdot \rho^{p^{+}} / 2$ such that

$$
J_{\lambda}(u) \geq a>0
$$

The proof of Lemma 4 is complete.

Lemma 5. There exists $\varphi \in H$ such that $\varphi \geq 0, \varphi \neq 0$ and $J_{\lambda}(t \varphi)<0$, for $t>0$ small enough.

Proof. Since $q^{-}<p^{-}$it follows that there exists an integer $k_{0}$ such that $0<k_{0}<T+1$ and $q^{-}=q\left(k_{0}\right)<p^{-} \leq p\left(k_{0}\right)$. We define the function $\varphi: \mathbb{Z}[0, T+1] \rightarrow \mathbb{R}$ such that $\varphi\left(k_{0}\right)=1$ and $\varphi(k)=0$, for any $k \in \mathbb{Z}[0, T+1] \backslash\left\{k_{0}\right\}$. We deduce that $\varphi \in H$ and for any $t \in(0,1)$ we have

$$
J_{\lambda}(t \cdot \varphi)=\frac{t^{p\left(k_{0}-1\right)}}{p\left(k_{0}-1\right)}+\frac{t^{p\left(k_{0}\right)}}{p\left(k_{0}\right)}-\lambda \cdot \frac{t^{q\left(k_{0}\right)}}{q\left(k_{0}\right)} \leq \frac{2 \cdot t^{p^{-}}}{p^{-}}-\frac{\lambda \cdot t^{q^{-}}}{q^{+}} .
$$

The above inequality implies

$$
J_{\lambda}(t \cdot \varphi)<0
$$

for any $t<\delta^{1 /\left(p^{-}-q^{-}\right)}$where

$$
0<\delta<\frac{p^{-} \cdot \lambda}{2 \cdot q^{+}}
$$

The proof of Lemma 5 is complete.

Proof of Theorem 3. Let $\lambda^{*}>0$ be defined as in (14) and $\lambda \in\left(0, \lambda^{*}\right)$. By Lemma 4, it follows that on the boundary of the ball centered at the origin and of radius $\rho$ in $H$, denoted by $B_{\rho}(0)$, we have

$$
\begin{equation*}
\inf _{\partial B_{\rho}(0)} J_{\lambda}>0 \tag{15}
\end{equation*}
$$

On the other hand, by Lemma 5, there exists $\varphi \in H$ such that $J_{\lambda}(t \varphi)<0$ for all $t>0$ small enough. Moreover, relation (6) and Lemma 1 (b) imply that for any $u \in B_{\rho}(0)$, we have

$$
J_{\lambda}(u) \geq \frac{C_{3}}{p^{+}}\|u\|^{p^{+}}-\frac{\lambda}{q^{-}}\left(c_{q^{-}} T \cdot\|u\|^{q^{-}}+c_{q^{+}} T \cdot\|u\|^{q^{+}}\right) .
$$

It follows that

$$
-\infty<\underline{c}:=\frac{\inf }{B_{\rho}(0)} J_{\lambda}<0
$$

We let now

$$
0<\epsilon<\inf _{\partial B_{\rho}(0)} J_{\lambda}-\inf _{B_{\rho}(0)} J_{\lambda} .
$$

Applying Ekeland's variational principle to the functional $J_{\lambda}: \overline{B_{\rho}(0)} \rightarrow \mathbb{R}$, we find $u_{\epsilon} \in$ $\overline{B_{\rho}(0)}$ such that

$$
\begin{aligned}
& J_{\lambda}\left(u_{\epsilon}\right)<\frac{\inf }{B_{p}(0)} J_{\lambda}+\epsilon \\
& J_{\lambda}\left(u_{\epsilon}\right)<J_{\lambda}(u)+\epsilon \cdot\left\|u-u_{\epsilon}\right\|, u \neq u_{\epsilon} .
\end{aligned}
$$

Since

$$
J_{\lambda}\left(u_{\epsilon}\right) \leq \inf _{B_{\rho}(0)} J_{\lambda}+\epsilon \leq \inf _{B_{\rho}(0)} J_{\lambda}+\epsilon<\inf _{\partial B_{\rho}(0)} J_{\lambda},
$$

we deduce that $u_{\epsilon} \in B_{\rho}(0)$. Now, we define $I_{\lambda}: \overline{B_{\rho}(0)} \rightarrow \mathbb{R}$ by $I_{\lambda}(u)=J_{\lambda}(u)+\epsilon \cdot\left\|u-u_{\epsilon}\right\|$. It is clear that $u_{\epsilon}$ is a minimum point of $I_{\lambda}$ and thus,

$$
\frac{I_{\lambda}\left(u_{\epsilon}+t \cdot v\right)-I_{\lambda}\left(u_{\epsilon}\right)}{t} \geq 0
$$

for small $t>0$ and any $v \in B_{1}(0)$. The above relation yields

$$
\frac{J_{\lambda}\left(u_{\epsilon}+t \cdot v\right)-J_{\lambda}\left(u_{\epsilon}\right)}{t}+\epsilon \cdot\|v\| \geq 0
$$

Letting $t \rightarrow 0$, it follows that $\left\langle J_{\lambda}^{\prime}\left(u_{\epsilon}\right), v\right\rangle+\epsilon \cdot\|\nu\|>0$ and we infer that $\left\|J_{\lambda}^{\prime}\left(u_{\epsilon}\right)\right\| \leq \epsilon$.
We deduce that there exists a sequence $\left\{w_{n}\right\} \subset B_{\rho}(0)$ such that

$$
\begin{equation*}
J_{\lambda}\left(w_{n}\right) \rightarrow \underline{c} \text { and } J_{\lambda}^{\prime}\left(w_{n}\right) \rightarrow 0 \tag{16}
\end{equation*}
$$

Since the sequence $\left\{w_{n}\right\}$ is bounded in $H$, there exists $w \in H$ such that, up to a subsequence, $\left\{w_{n}\right\}$ converges to $w$ in $H$. So, by (16),

$$
\begin{equation*}
J_{\lambda}(w)=\underline{c}<0 \quad \text { and } J_{\lambda}^{\prime}(w)=0 \tag{17}
\end{equation*}
$$

We conclude that $w$ is a nontrivial weak solution for problem (1).
The proof of Theorem 3 is complete.

## Acknowledgements

M. Mihăilescu and V. Rădulescu have been supported by Grant CNCSIS PN II-79/2007 Procese Neliniare Degenerate şi Singulare. V. Rădulescu also acknowledges the support through Grants 2-CEx06-11-18/2006 and GAR-18/315/2008. S. Tersian has been supported by Grant VU-MI-02/05 of the National Research Fund in Bulgaria. First and third authors thank Department of Mathematics and its Applications, CEU, Budapest for the opportunity to meet and discuss on discrete boundary value problems.
